INTRODUCTION	Ref: TAR3-TMES
OBJECTIVE OF THIS DOCUMENT	

1. INTRODUCTION

1.1. Objective of this Document

The aim of this document is to provide the technical mapping of the functional messages and exchange scenarios of the TARIC3 system-to-system interface defined in [\[TAR3-FMES\]](#). The messages are mapped on XML messages.

1.2. Intended Audience

The document is intended for people responsible for designing and implementing applications participating in the TARIC system-to-system interface. Knowledge of at least XML, an XPath and XML schema is assumed. Please consult [\[XML\]](#), [\[XPath\]](#) and [\[XML-Schema\]](#) for their respective specifications.

1.3. Structure of this Document

First, a description of the technical exchange of messages is given in chapter 2. Then the functional parts of the messages defined in [\[TAR3-FMES\]](#) are mapped on XML elements and attributes in chapter 3. The same operation is described for technical parts of messages not described in [\[TAR3-FMES\]](#) but required to automate the processing of messages in chapter 4. The result of this mapping gives a complete set of XML schemas [\[XML-Schema\]](#) that are fully described in chapter 5. Finally, examples of XML messages based on these XML schemas are given in chapter 6.

1.4. Abbreviations and acronyms

CN	Combined Nomenclature
ERN	Export Refund Nomenclature
FTS	Full Temporary Stop
HS	Harmonised System
OJ	Official Journal
PTS	Partial Temporary Stop
TARIC	TARif Intégré Communautaire

TECHNICAL ISSUES	

2. INFORMATION EXCHANGE SCENARIOS

This chapter explains how the functional information exchange scenarios are technically realised. All the functional scenarios are taken from [[TAR3-FMES](#)].

2.1. Technical issues

This section describes some issues that technical scenarios have to cope with. It also defines some concepts used in the technical scenarios.

2.1.1. Participating party

The central system, the Member States and Commission internal users exchanging messages through the TARIC3 interface are known as participating parties.

In a scenario, there is always a initiating party.

2.1.2. Communication queues

An asynchronous communication paradigm will be used to exchange messages between the participating parties.

Each party that must receive notification messages must publish the name of the queue in which it waits for those messages. This queue is known as the party's incoming queue. For example, the Member States must publish the names of the queues in which they wait for notification messages.

If a situation occurs in which an incoming message cannot be decoded, the receiving party must inform the sending party of the situation and interrupt the process. This communication might be done in an ad-hoc manner (e.g. e-mail or phone call to the Commission staff responsible for operating the TARIC3 system). After the problem has been solved the pending messages may be resend to the Member State in one message or in a number of sequential messages.

The CCN/CSI infrastructure will be used for the implementation of the communication queues.

2.1.3. Rejected envelopes

The receiving party can only reject an envelope if it cannot decode the envelope. Then, a fatal error report indicating the reason of the rejection must be put in the receiving party log file. This report can be send to the Commission staff responsible for operating the TARIC3 system in an ad-hoc manner (e.g. by e-mail or by phone call).

2.2. Technical exchange scenario

In the TARIC3 project, the information is stored in a central repository owned by the Commission. This central repository is known as the TARIC3 system and is not accessible to the Member States.

Member States have their own systems storing the entirety or some parts of the TARIC information. Two functional information exchange scenarios are defined in

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
INFORMATION EXCHANGE SCENARIOS	Ref: TAR3-TMES
TECHNICAL EXCHANGE SCENARIO	

[[TAR3_FMES](#)] to enable Member States to synchronize their local system with the TARIC3 system:

- the full extraction scenario;
- the differential extraction (extraction of the modification file) scenario.

From a technical perspective these scenarios are implemented using the “Notification of change” scenario defined in [[STDEV_TMES](#)]. However, it must be stressed that technical messages are only defined for the notification of information sent from the TARIC3 system to the Member States’ systems.

In this scenario, the TARIC information is updated in the TARIC3 system by the users of the Commission and notification message is sent (communicated) to the Member States’ systems. The Member States’s systems are responsible for handling the notifications it receives.

The scenario does not foresee communication from the Member States’ systems, in an automated way, on problems that could occur whilst processing the notifications received from the TARIC3 system. Thus, no message is defined to enable a Member State system to report such problems. If such a situation occurs this communication might be done in an ad-hoc manner (e.g. e-mail or phone call to the Commission staff responsible for operating the TARIC3 system).

2.2.1. Full extraction

The full extraction scenario defined in [[TAR3_FMES](#)] (chapter 4) is technically conducted as explained in the technical exchange scenario described in section 2.1.

The execution of this scenario is triggered by a request of a Member States that wishes to perform an initial load of its local system. However, this is not an automated process and it must be performed by an operator (staff of the Commission).

The TARIC3 system prepares one or more messages that conform to the message specification defined in section 4.1 depending on the following parameters:

- active date
- archive date
- languages to extract
- destination id for which the filters are to be applied

The "active date" extracts all records for which the end date is greater than or equal to the "active date" (open dates are considered to be greater than).

The "archive date" is optional. This date will extract all records which have an end date equal to or greater than the archive date and an end date which is less than the active date.

The "languages" parameter is optional, as is the "destination id.". Languages to be chosen are specified either directly through the "languages" parameter or through

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
INFORMATION EXCHANGE SCENARIOS	Ref: TAR3-TMES
TECHNICAL EXCHANGE SCENARIO	

the (*possibly empty set of*) languages filters of the destination id. If no language is specified, no language data will be extracted. The languages are entered in a contiguous way, e.g. "ENDENL" indicates that English, German and Dutch are required.

The "destination id." is optional. If this is entered, the (*possibly empty set of*) destination filters defined for this destination id will be applied to the full extract (see section 2.3.1).

Based on the input parameters, several messages will be generated:

- archive language independent data with the following message.id **aaaaaaaaARCH** where:

aaaaaaaa is the application id which is passed to the function by the batch scheduler (e.g. OBEXT --> Output Bridge EXtraction);

ARCH is a constant value.

- archive language dependent data (1 message per language) with the following message.id **aaaaaaaaARCHll** where:

aaaaaaaa is the application id which is passed to the function by the batch scheduler (e.g. OBEXT --> Output Bridge EXtraction);

ARCH is a constant value

ll is the language.

- static data (data without validity period) + active language independent data with the following message.id **aaaaaaaaACT** where:

aaaaaaaa is the application id which is passed to the function by the batch scheduler (e.g. OBEXT --> Output Bridge EXtraction);

ACT is a constant value.

- active language dependent data (1 message per language) with the following message.id **aaaaaaaaACTll** where:

aaaaaaaa is the application id which is passed to the function by the batch scheduler (e.g. OBEXT --> Output Bridge EXtraction);

ACT is a constant value

ll is the language.

The extraction is based on the working database.

As it may represent a huge amount of data, the full extraction messages are copied on a DVD that is sent to the Member States that requested the full extraction.

The Member States's systems processes the full extraction messages in sequence.

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
INFORMATION EXCHANGE SCENARIOS	Ref: TAR3-TMES
TECHNICAL EXCHANGE SCENARIO	

Sequence of processing:

1. static data + active language independent data (message: "aaaaaaaaACT")
2. active language dependent data (message: "aaaaaaaaACTII")
3. archive language independent data (message: "aaaaaaaaARCH")
4. archive language dependent data (message: "aaaaaaaaARCHII")

The operations present in the messages must be successfully processed in the order they appear in the message.

It is worth noting that in order to be synchronized with the TARIC3 system the Member States' systems have to receive and successfully process the differential extractions produced after the full extraction.

2.2.2. Differential Extraction

The differential extraction scenario defined in [[TAR3 FMES](#)] (chapter 4) is technically conducted as explained in the technical exchange scenario described in section 2.1.

The execution of this scenario is automatically triggered by the TARIC3 system. They are generated regularly, usually every workday, and transmitted to the national administrations. A differential extraction message contains all the updates to the TARIC database made since the previous differential extraction message was generated.

The TARIC3 system prepares a notification message that conforms to the message specification defined in section 4.1. This notification message contains all changes that occurred on the TARIC information stored in the TARIC3 system after the former extraction until the extraction timestamp. Moreover, if a given data item has changed several times since the former extraction all changes are communicated in the differential extraction.

It is important to stress that the changes that are present in the former extractions are not present in the newly generated differential extraction. From a technical perspective this means that only changes that occurred on TARIC information at a timestamp greater than ($>$) the extraction timestamp of the former extraction and lesser than or equal to (\leq) the extraction timestamp of the new differential extraction are taken into account.

The TARIC3 system assigns to the differential extraction a sequence number equal to the sequence number of the former extraction incremented by one. Thus, there is no gap in the sequence numbers of the subsequent differential extractions.

The extraction period number is structured as follows: **yy****nnn** where

yy are the last two digits of the year and

nnn is a sequence number within the year (and starts at 001).

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
INFORMATION EXCHANGE SCENARIOS	Ref: TAR3-TMES
TECHNICAL EXCHANGE SCENARIO	

Destinations (Member States) are either selected explicitly when submitting the extraction request, or implicitly all destinations marked ‘for update extract’ are selected (see section 2.3.1).

For each selected destination, a message will be created with the following message.id **Td^{dd}eeeeee.messageformat**, where:

- T** is a constant;
- dd** is the destination-id;
- eeeeee** is the extraction period number;
- . is a constant;

messageformat is the message format which can be one of the following:

EDIFACT2, EDIFACT3, XML

The differential extraction messages are communicated to the Member States in an asynchronous way via CCN. Thus, the messages are put on the CCN queue of each Member States’ system. Note that the message is first filtered out according to the needs of each particular Member State system.

The Member States’ systems processes the differential extraction messages. It is worth mentioning that due to the use of CCN queues to communicate differential extractions to the Member States’ systems it might happen that differential extractions arrive out of sequence. The Member States’ systems must pay attention to this and process differential extractions in sequence. Member States could inform the TARIC staff whenever such a situation occurs. As there is no automated mechanism foreseen this must be done in an ad-hoc manner (e.g. e-mail or phone call).

Alternatively, the TARIC3 operator at the Commission may also send existing differential extractions to a Member States that has requested them. This may be necessary when a Member State has received and successfully processed a full extraction and missed some of the subsequent differential extractions.

2.2.3. Transactions

Operations that must be processed as an atomic transaction because they correspond to a single business operation are grouped together in a “Transaction”. The TARIC3 system assigns a unique “Transaction identifier” to each “Transaction” on the record level. It must be stressed that the values of this “Transaction identifier” are not necessarily continuous.

The operations present in the messages must be successfully processed in the order they appear in the message. The records are sorted by transaction identifier and record identifier within the messages. Operations grouped in a “Transaction” must be processed as an atomic transaction.

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
INFORMATION EXCHANGE SCENARIOS	Ref: TAR3-TMES
CONFIGURATION IMPLICATIONS	

The Transaction identifier at the level of the envelope has no special meaning except for grouping the messages together. An envelope transaction may contain more than one record transactions but all records with the same record transaction must be included in the same envelope transaction.

2.3. Configuration implications

In this section, some technical issues implied by the technical message exchange scenarios are described.

2.3.1. Destination filters on full and differential extractions

Before sending a full extraction or a differential extraction to a given Member State, the TARIC3 system applies some *destination filters* to remove information not necessary for this Member States.

These filters can act on different subjects:

- the transmission items (record code/subcode) they want to receive;
- the language versions they want to receive;
- the measure types they do NOT want to receive;
- the chapters they do NOT want to receive.

The Commission decides in dialogue with the Member State which filters that have to be applied on the full extractions and differential extractions before sending them. Note that the same set of filters is applied on the full extractions and on the differential extractions for this Member State. The TARIC3 system will be configured to apply these filters on the extractions it sends to this Member State.

As there is no message defined to communicate this information to the Commission, this must be done in an ad-hoc manner (e.g. e-mail or phone call).

2.3.2. CCN queues

In the differential extraction scenario, the TARIC3 system puts the differential extraction message on the CCN queue of each particular Member State.

Each Member State must create a CCN queue, grant a write access on this queue to the TARIC3 system, and communicate the name of this queue to the Commission staff responsible for the operation of the TARIC3 system. The TARIC3 system will be configured to send differential extractions to this queue.

As there is no message defined to communicate this information to the Commission, this must be done in an ad-hoc manner (e.g. e-mail or phone call).

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
DETAILED MESSAGE DESCRIPTION CATALOGUE	Ref: TAR3-TMES
COMMON DATA STRUCTURE AND ELEMENTS	

3. DETAILED MESSAGE DESCRIPTION CATALOGUE

This chapter describes the encoding in XML of each functional message described in [TAR3-FMES]. The mapping guidelines given in [STDEV-TMES] have been applied to define the mapping of the functional messages defined in [TAR3-FMES] on XML messages.

A specific notation is introduced to access elements within a list: item.list/itemType. This means that we have a single element ‘item.list’, which can contain multiple items of the same type ‘itemType’.

3.1. Common data structure and elements

All message element of type data record are listed in the following sections.

3.1.1. Transmission comment

TRANSMISSION COMMENT			transmission.comment
Comment SID	M	n 8	comment.sid

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
DATA DICTIONARY FOR TECHNICAL ELEMENTS AND ATTRIBUTES	Ref: TAR3-TMES
MESSAGE “TRANSMISSION”	

4. DATA DICTIONARY FOR TECHNICAL ELEMENTS AND ATTRIBUTES

This chapter contains the definition of the transmission element required to implement the information exchange scenarios at the technical level.

4.1. Message “Transmission”

TRANSMISSION		transmission
RECORD	1..N	<i>transaction/record</i>
DATA RECORD	1..1	

RECORD			<i>Record</i>
Transaction identifier	M	n 10	<i>transaction.id</i>
Record code	M	an 3	<i>record.code</i>
Sub record code	M	an 2	<i>subrecord.code</i>
Record sequence number	M	n 8	<i>record.sequence.number</i>
Update type	M	an 1	<i>update.type</i>

The *data record* points to one of the messages defined in “3.1 Common data structure and elements”.

TAXUD/D3 – TARIC-3 Technical Message Exchange Specifications	
XML SCHEMAS	Ref: TAR3-TMES
ENVELOPE SCHEMA	

5. XML SCHEMAS

5.1. Envelope schema

The schema for message envelope can be found in annex 1. The envelope schema is common to all applications of the Commission.

The application schema message element must extend the *abstract.message* element.

5.2. XML Namespace Schema

The XML namespace schema is a standard W3C schema that defines the *xml:lang* attribute. This schema can be found in **0** (the original can be found at <http://www.w3.org/2001/03/xml.xsd>).

5.3. TARIC-3 messages schema

The schema defines the TARIC-3 messages, described in [[TAR3-FMES](#)]. It can be found in annex 2.

The following table lists the headers that must be present in a transfer message envelope.

Element	Header	Meaning
envelope	Version	Indicates the TARIC-3 interface specification version.
	From	Uniquely identifies the sending party (the TARIC3 system)

Table 1: Required headers of a transfer or query message

6. MESSAGE SAMPLES

This chapter contains some message samples of the information exchanges.

6.1. Measure

    </xs:documentation>
  </xs:annotation>
  <xs:annotation>
    <xs:documentation>This schema defines attributes and an attribute group
      suitable for use by
      schemas wishing to allow xml:base, xml:lang or xml:space attributes
      on elements they define.
    </xs:documentation>
  </xs:annotation>
  To enable this, such a schema must import this schema
  for the XML namespace, e.g. as follows:
  &lt;schema . . .>
  . . .
  &lt;import namespace="http://www.w3.org/XML/1998/namespace"
    schemaLocation="http://www.w3.org/2001/03/xml.xsd"/>

  Subsequently, qualified reference to any of the attributes
  or the group defined below will have the desired effect, e.g.

  &lt;type . . .>
  . . .
  &lt;attributeGroup ref="xml:specialAttrs"/>

  will define a type which will schema-validate an instance
  element with any of those attributes</xs:documentation>
</xs:annotation>
<xs:annotation>
  <xs:documentation>In keeping with the XML Schema WG's standard versioning
  policy, this schema document will persist at
  http://www.w3.org/2001/03/xml.xsd.
  At the date of issue it can also be found at
  http://www.w3.org/2001/xml.xsd.
  The schema document at that URI may however change in the future,
  in order to remain compatible with the latest version of XML Schema
  itself. In other words, if the XML Schema namespace changes, the version
  of this document at
  http://www.w3.org/2001/xml.xsd will change
  accordingly; the version at
  http://www.w3.org/2001/03/xml.xsd will not change.
